TITLE : A Review of Cermet Materials in Current Use

ORIG. PUB. : Mechanik, 32, No 2, 58-63 (1959)

ABSTRACT : The author reviews the use of cermet materials (CM). Using literature data, the author has tabulated data on the properties of the following: Al_2O_3 , Cr_2O_3 , ZrO_2 , MgO ; Mo_2B , CrB , Cr_3B , TiB_2 , ZrB_2 , AlB_2 ; $MoSi_2$, $ZrSi_2$, $ThSi_2$; TiC , TaC , SiC , B_4C ; and the metals Al, Ag, Co, Cr, Fe, Mn, Ni, and W, all of which are used as raw materials in the production of CM. According to their structure, the CM are divided into six groups: CM with ceramic skeletons, CM with metallic

Gibas, Tadeusz, Master of Engineering
Spieki ceramiczne i cermetale (Sintered Ceramics and Cermets)
Warszawa, Wydawn. Naukowo Techniczne, 1961. 257 p. Errata slip
inserted. 2690 copies printed.

Reviewer: Bohdan Ciszewski, Doctor of Engineering; Scientific Ed.:
Wiktor Surowiak, Master of Engineering; Tech. Ed.: H. Fiećko.

PURPOSE: This book is intended for technical personnel in aircraft
manufacture, chemistry, electronics, tool design and manufacture,
and nucleonics.

COVERAGE: The book deals with sintered ceramic materials and cer-
mets and their use as semiconductors, electrical insulators, tool
elements and materials for nuclear power apparatus. The raw ma-
terials, the processes, and the equipment used in manufacturing
sintered ceramic materials and products are described in detail.
The resistance of sintered ceramic materials and cermets to heat,
fire, chemical action, and wear is discussed. The book is re-

The preparation and some physical properties of poly-
(nitrocellulose). ~~Cuba Reinty, János Oltay, and László~~
~~Kis (Hungary), György I. P. Kovács (Hungary), Tamas~~
~~Budapest, Hungary). Magyar Kém. Folyóirat 66, 406-70~~
~~(1968).~~ The title compd. (I) was prepd. from MeNO_2 (II)
through $\text{O}_2\text{NCH}_2\text{CH}_2\text{OH}$ (III) and $\text{O}_2\text{NCH}_2\text{CH}_2$ (IV). For
the prepn. of III the app. of Hays (CA 47, 482g) was
applied with a mantle contg. H_2O at 80° . To a mixt. of 18g
g. II and of a nonvolatile org. acid being equiv. to the alkali
used as catalyst, 88.5 g. of 35% CH_3CO soln. was added, and
the mixt. was made alk. to pH 10 with 10% NaOH , at a
rate of 10-20 drops/min. at 120 mm. and $45-5^\circ$. The oil
bath used for boiling II was kept at $130-5^\circ$. After distg. the
remaining II and H_2O 74 g. crude III was obtained. A mixt.
of 80 g. crude III and 100 g. phthalic anhydride was kept at
 $150-5^\circ/20$ mm. until homogeneous, then IV distd. at 175°
(80 g. after drying with CaCl_2). IV (80 g.) was dropped
into 800 ml. H_2O during 15 min. with stirring at room temp.
to give 80 g. I. About 4-5% I dissolved in Me_2CO and had a
mol. wt. of 1200-1400 as detd. by the modified Barger
method. In cyclohexanone the av. mol. wt. was found to
be 8000. In the following list the explosion heat in kcal./
kg., the working capacity (Treatal value) in ml. and the
striking sensibility (3 kg.; 7.68 mm.; 50%) in cm. are
given: Hg fulminate, 420, 150, 5; trinitrotoluene, 928, 235,
50-100; NH_4NO_3 , 846, 165, 180-200; black gunpowder, 710,
30, 85-120; I, 720, 114, 70-90; 67% I + 33% NH_4NO_3 .

800, 875. — 60% I + 40% NH_4NO_3 , —, 849, —; 34% I +
66% NH_4NO_3 , 1087, —, —; 30% I + 70% NH_4NO_3 , 1212,
285. — The explosive properties of I were improved by
adding NH_4NO_3 . The max. of the combustion heat was ob-
tained at 85% NH_4NO_3 content, that of the working capacity
at 85%.

GIBER, J.

Analysis of the products of the nitration of methane in the gaseous state. Determination of nitromethane in the presence of nitrite. János Giber and Tibor Meisel (Műszaki Egyetem, Budapest, Hung.) *Magyar Kém. Folyóirat* 85, 260-27 (1950).—The method is based on the quant. transformation of the nitromethane into nitrite and the photometric detn. of the nitrite thus obtained. It has a relative accuracy of 3% and a sensitivity of 0.1 γ /ml. To det. the nitrite content, pipet 2 ml. stock soln. into a 100-ml. volumetric flask, add 20 ml. distd. water, 1 ml. 1:5 aq. HCl, and 5 ml. 1% sulfanilic acid soln. Shake 1 min. and add 10 ml. 1% hydroxynaphtholic acid soln. contg. 4% NaOH. Fill to the mark with distd. water, allow to stand 10 min., and det. the nitrite content of the red soln. with a Pulfrich photometer with a green filter. To det. the nitromethane content in the presence of nitrite, pipet 2 ml. stock soln. into a 15-ml. flask fitted with reflux. Add 2 ml. 80% NaOH soln. and 1 ml. 80% H₂O₂. Boil 10 min. with a microburner. Transfer into a 100-ml. volumetric flask and fill to the mark with distd. water. Neutralize an aliquot portion and det. the nitrite content as described above. Calc. the nitromethane content from the difference of the 2 results. To det. the nitromethane content in the presence of excess nitrite add to 2 ml. stock soln. in a dry beaker sufficient carbamide to decomp. approx. 80% of the nitrite content and keep on a 30° water bath for 20 min. Pipet 2 ml. each into two 15-ml. flasks fitted with a reflux condenser, add 2 ml. each 80% NaOH, and boil 10 min. Det. the nitrite content of one of the solids as described above. Add 1 ml. 80% H₂O₂ to the other soln., boil 10 min., and proceed as described above. Calc. the nitromethane content from the 2 results and that of the original nitrite content. The method is suitable for the detn. of other mononitroparaffins. HNO₃ and other compounds normally present in the nitration products of CH₄ with HNO₃ and (or) NO₂ will not interfere. O. J. Szalay

Kinetics of nitration of methane with nitric acid in gaseous phase. I. Experimental results. Gábor Schay and János (Magyar Kém. Folyóirat 63, 811-18(1959)).—CH₄ was chosen as the model reaction of nitration with HNO₃ in gaseous phase. A flow-type lab. reactor was developed where contact time, temp., and the amt. of various reagents could be varied. The time for a single nitration was approx. 1.5 min., the amt. of MeNO₂ formed in one expt. was about 0.1 g. An analytical method was developed for quant. analysis of the product without previous sepn. II. Kinetic characterization of the nitration. *Ibid.* 313-18.—The conversion of the nitration of methane in gaseous phase was studied as a function of contact time (0.5-7 sec.), r_1 , and temp. (1 230-490°). The curves of the conversion plotted against temp. or contact time exhibit max. The optimal conversion was 15.5% (t = 490°, r_1 = 2 sec.). The complex nitration process consists of 3 main reactions: nitration, parallel oxidn. yielding NO, and consecutive decompn. of MeNO₂. The character of the conversion curves of nitration with NO₂ were similar to those observed with HNO₃ but under the conditions that were favorable for the nitration with HNO₃, NO₂ had practically no nitrating effect. The effect of varying the concn. of CH₄ and HNO₃ was investigated. The reaction order for both reagents was detd. from the initial rate of the nitration reaction. Activation energy of nitration and parallel oxidn. was calcd. from the conversion vs. temp. curves. The approx. rate equation calcd. from exptl. data was: $w_1 = 0.9 \times 10^4 \cdot e^{-4.5/RT} [\text{CH}_4]^{1.5} [\text{HNO}_3]$. G. Schay

GIBER J.

Distr: 483d

Kinetics of nitration of methane with nitric acid in gaseous phase. III. A hypothetical reaction mechanism. Géza Schay and János Giber (Univ. Technol., Budapest, Hung.). *Magyar Kém. Folyóirat* 83, 347-51 (1959); cf. preceding abstr.—According to expts., the nitration of CH₄ in gaseous phase may be considered as a radical step reaction, though occurrence of possible short chains should not be excluded. Probable mechanism proposed: $\text{HONO}_2 + \text{N}_2 \rightarrow \text{NO}_2 + \text{OH} + \text{N}_2$ (1), $\text{HONO}_2 + \text{CH}_4 \rightarrow \text{NO}_2 + \text{OH} + \text{CH}_3$ (2), $\text{OH} + \text{CH}_4 \rightarrow \text{Me} \cdot + \text{H}_2\text{O}$ (3), $\text{OH} + \text{HNO}_2 \rightarrow \text{NO}_2 + \text{H}_2\text{O}$ (4), $\text{Me} \cdot + \text{NO}_2 \rightarrow \text{MeNO}_2$ (5), $\text{Me} \cdot + \text{NO}_2 \rightarrow \text{Me} \cdot \cdot \cdot \text{ONO} \rightarrow \text{MeO} \cdot + \text{NO}$ (6). A chain mechanism of $\text{HNO}_2 + \text{N}_2 \rightarrow \text{NO}_2 + \text{OH} + \text{N}_2$ (7), $\text{HNO}_2 + \text{CH}_4 \rightarrow \text{NO}_2 + \text{OH} + \text{CH}_3$ (8), $\text{OH} + \text{CH}_4 \rightarrow \text{Me} \cdot + \text{H}_2\text{O}$ (9), $\text{Me} \cdot + \text{HNO}_2 \rightarrow \text{NO}_2 + \text{OH}$ (10), $\text{Me} \cdot + \text{NO}_2 \rightarrow \text{MeNO}_2$ (11) (repenting steps are 9 and 10, end reaction is 11) does not agree with exptl. facts. The results indicate that under favorable conditions for nitration with HNO_2 neither NO_2 nor undecompd. HNO_2 can nitrate alone. An equation is proposed for the reaction rate on the basis of the probable reaction scheme. This equation is in agreement with the empirical

rate equation. The nitration is inhibited by NO , NO_2 , CO , and H_2 . Nitration is carried out at 440°, time exposure to the heat is 1 sec. Concn. of HNO_2 was approx. 6 mole-% and the ratio of CH_4 to HNO_2 8:1. IV. Thermal decomposition of nitromethane in the gaseous phase, in the presence of nitrogen dioxide and nitric acid. Géza Schay, János Giber, József Tamás, and Demeter Sós (Univ. Technol., Budapest, Hung.). *Ibid.* 351-4.—The effect of NO_2 and concd. HNO_2 on the thermal decompn. of MeNO_2

in gaseous phase was studied as a function of temp. and contact time. With increasing concn. of NO_2 and HNO_2 the decompn. of MeNO_2 first increased, then, after reaching a max., decreased below the rate of thermal decompn. or MeNO_2 alone. At high concns. of NO_2 (above 17 NO_2 :1 MeNO_2) polynitro compds. were formed. No detailed conclusions could be drawn from these expts. as to the mechanism of the decompn. reaction. A mechanism serving as working hypothesis was offered. Peter Marcel-Barna.

TITLE: Experimental results obtained on the first electrosag furnace built in France according to a Soviet license

SOURCE: Stal'. no. 2, 1966, 135-139

TOPIC TAGS: steel alloy, steel industry, steel microstructure, steel impurity, austenitic steel

ABSTRACT: The performance of the first Soviet-built electrosag steel furnace in France is described. The performance of the furnace was tested on a number of alloy and austenitic steels. The chemical composition, the usual mechanical properties, microstructure, and the distribution of nonmetallic impurities in the steel ingots were determined. The experimental results are presented in graphs and tables (see Fig. 1). It is concluded from the experimental results that the furnace performance was highly satisfactory and that the electrosag method of steel smelting seems to be very promising indeed.

TITLE: Experimental results obtained on the first electrosag furnace built in France according to a Soviet license

SOURCE: Stal'. no. 2, 1966, 135-139

TOPIC TAGS: steel alloy, steel industry, steel microstructure, steel impurity, austenitic steel

ABSTRACT: The performance of the first Soviet-built electrosag steel furnace in France is described. The performance of the furnace was tested on a number of alloy and austenitic steels. The chemical composition, the usual mechanical properties, microstructure, and the distribution of nonmetallic impurities in the steel ingots were determined. The experimental results are presented in graphs and tables (see Fig. 1). It is concluded from the experimental results that the furnace performance was highly satisfactory and that the electrosag method of steel smelting seems to be very promising indeed.

Two cases of haemorrhagic diathesis of vascular origin are described, in which 1-week treatment with prolonged sleep induced by luminal proved to be very efficient. In the first case in which the disease lasted 10 months and was accompanied by diffuse dermatitis, and every kind of treatment proved to be inefficient, a lasting, persisting so far for 5 yr., complete recovery was obtained after sleep treatment. In the second case, in which the disease lasted uninterruptedly for 9 yr., a very marked alleviation of symptoms was obtained, so that the patient was able to resume work. In this case the improvement already lasts 5 yr. and according to the patient, the treatment with sleep brought about the best result of all methods of treatment applied until now, in the course of 9 yr. It was emphasized that the first patient was a typical neurasthenic; in the second patient symptoms of transient schizophrenic psychosis, which might point to a psychopathic origin, appeared. The opinion of various authors on the participation of the nervous factor in the pathogenesis of haemorrhagic diathesis of vascular origin are mentioned, and the hope is expressed that the consideration of that factor may bring about better results of the treatment than those hitherto obtained.

skopii w rozpoznawaniu zapalenia żołądka. The role of gastroscopy
in the diagnosis of gastritis PRZEGL. LEK. 1956, 12/11 (17-
330) Tables 1

Gastritis is not considered to be the most important indication for gastroscopy and gastroscopy should not be considered the most significant examination in the diagnosis of gastritis. For practical purposes functional tests are of greater value than the appearance of the gastric mucosa; these tests and other clinical data should be given much greater consideration in the general classification of gastritis. Gastroscopic pictures in various forms of gastritis are outlined; uncertainty of endoscopic criteria and the common lack of a clearcut border between 'normal' and 'pathological' are emphasized.

4860. GIBIŃSKI K. 3. Klin. Ch. Wewn. Sl. A. M., Bytom. Bezoary żołądka. Bezoars of the stomach POL. ARCH. MED. WENĘT. 1956, 26/9 (1413-1418)
Illus. 4

Two cases of phytobezoars are described. The second case is of special interest because the bezoar was formed from fibres, from Radix symphyti. In the available literature no mention was found of phytobezoars of that origin. In both cases gastroscopy had a decisive significance for the correct diagnosis.

310. SERUM TRANSAMINASE IN LIVER AND BILE TRACT DISEASES. Transaminaza surowicza w chorobach wątroby i dróg żółciowych. Grudziński K. and Kokot F. III Klin. Chor. Wewn. Sz. A. M., Bytom. POL. TYG. LEK. 1957, 12/48 (1841-1846) Graphs 6 Tables 2

In 40 patients with various liver diseases the behaviour of the glutamic-pyruvic transaminase activity in the blood serum was examined. The following conclusions were drawn from the results obtained: the investigations confirm the observations of Wróblewski et al. and Chinsky et al. who have found intensification of the transaminase activity in various liver and bile tract diseases. The present explanation of the phenomenon of increase of the transaminase activity in liver and bile tract diseases is not sufficient. Determination of the transaminase activity has no such differential diagnostic significance for liver diseases as it has in heart infarction. It seems, however, that the investigations on this ferment in liver diseases merit further effort. No parallel has been proved between the results of the functional liver tests and the glutamic-pyruvic transaminase activity in the blood serum, as Merrill et al. have attempted to show.
